Genomic Sequence for Oryza sativa, Nipponbare strain, clone OSJNBa0067N01, from chromosome 3, complete sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genomic Sequence for Oryza sativa, Nipponbare strain, clone OSJNBa0067N01, from chromosome 3, complete sequence on Jun 20, 2001 this sequence version replaced gi:14209722.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data of (i.e., phred quality > 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                    Oryza sativa (japonica cultivar-group)

New tapetum- and pollen-specific promoter from tobacco, useful for preparing male sterile plants, particularly those with seedless fruits.

Claim 3; Page 64-65; 74pp; German.

This invention describes a novel nucleic acid (I) comprising a promoter that is specific for tapetum and pollen. The invention also describes (a) expression system containing at least one (I); (b) nucleic acid construct (III) containing (I) part part of an expressible nucleic acid (III); (c) vector containing (I), the system of (a), or (II); (d) calls, particularly plant cells, containing (I), the system of (a), (II) or the vector of (c); (e) plants containing cells of (d); (f) seeds from the

plants of (e); (g) hybrid seed produced by crossing a male sterile plant of (e); (h) production of male sterile plants by introducing (II) into a cell and regeneration to a plant; (i) restorer plants contening in one (or preferably many) cells a construct (IIa) of (I) and a sequence that cencedes an invertase different from the plants endogenous invertase; (j) plant that contains in one (or preferably many) cells both (II) and (IIa); (k) seeds from plants of (e), (i) and (j); and (m) method for cloning a promoter that is functionally homologous with (II. Constructs containing (I) and an invertase-encoding sequence are used to produce male-sterile plants (by co-suppression or antisense techniques) for preparation of hybrids, while constructs that contain (I) and a heterologous invertase-encoding sequence are used to prepare restorer plants (which allow propagation of the male-sterile plants). Seeds from these plants are used for in vitro embryogenesis of haploid or (double) (I) can also be used to prepare transgenic plants that show increased or production of endogenous materials, e.g. of plant hormones or provide high level expression in a tissue- and time-specific manner, and contains or provide high level expression in a tissue- and time-specific manner, and contains or provide high level expression in a tissue- and time-specific manner, and contains the require expense transgenic plants to chemicals) for contains the require expense transgenic temperature or chemicals) for contains the require expense transgenic temperature or chemicals) for contains the require expense transgenic temperature or chemicals) for contains the require expense transgenic temperature or chemicals) for contains the contains t ${}^{8}_{6}$

(I) can also be used to prepare transgenic plants that show increased or reduced production of endogenous materials, e.g. of plant hormones or proteins involved in provision of energy to developing tissue. (I) provide high level expression in a tissue- and time-specific manner, and do not require exogenous stimuli (e.g. temperature or chemicals) for

This invention describes a novel nucleic acid (I) comprising a promoter that is specific for tapetum and pollen. The invention also describes (a) expressible mothering at least part of an expressible nucleic acid construct (II) containing (I) plus at least part of an expressible nucleic acid (III); (c) vector containing (I), the system of (a), or (II); (d) cells, particularly plant cells, containing (I), the system of (a), (iI) or the vector of (c); (e) plants containing (I), the system of (a), (iI) or the vector of (c); (e) plants containing cells of (d); (f) seeds from the plants of (e); (g) hybrid seed produced by crossing a male sterile plant of (e); (h) production of male sterile plants by introducing (II) into a cell and regeneration to a plant; (i) restorer plants containing in one (or preferably many) cells a construct (IIa) of (I) and sequence that contains in one (or preferably many) cells both (II) and (IIa) of plant that contains in one (or preferably many) cells both (II) and (IIa) of (k) seeds from plants of (i) and (j); (l) fruits, particularly containing (I) and an invertase-encoding sequence are used to produce male-sterile plants (by co-suppression or antisense techniques) for preparation of hybrids, while constructs that contain (I) and a invertase-encoding sequence are used to prepare restorer plants (which allow propagation of the male-sterile plants). Seeds from these plants are used for in vitro embryogenesis of haploid or (double) diploid plants, and the new plants particularly produce seedless fruits.

(I) can also be used to prepare transgenic plants that show increased or reduced production of endogenous materials, e.g. of plant bowning or provide high level expression in a tissue and time specific manner, and the new plants energy to developing tissue. (I) remile involved in provision of endogenous and time specific manner, and the new lants energy to developing tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New tapetum- and pollen-specific promoter from tobacco, useful for
preparing male sterile plants, particularly those with seedless fruits.
                                                                                                                                                                                                                                                                                                                                                                  tapetum-specific; pollen-specific; promoter; seed; invertase;

cor preferably many) cells a construct (IIa) of (I) and a sequence that encodes an invertase different from the plants endogenous invertase; (j) plant that contains in one (or preferably many) cells both (II) and (IIa); (k) seeds from plants of (e) (i) and (j); and (m) method for cloning a promoer that is functionally bomologous with (I). Constructs containing (I) and an invertase-encoding sequence are used to produce male-sterile plants (by co-suppression or antisense techniques) for preparation of hybrids, while constructs that contain (I) and a loop functionally encoded to prepare restorer plants (which allow propagation of the male-sterile plants). Seeds from these plants are used for in vitro embryogenesis of haploid or (double) (I) can also be used for in vitro embryogenesis of haploid or (double) reduced production of endogenous materials, e.g. of plant hormones or reduced production of endogenous materials, e.g. of plant hormones or provide high level expression in a tissue- and time-specific manner, and contain (e.g. temperature or chemicals) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2819 icaaaaarcgaccaaaaaaccgacraaagricgicggriririraaaarararririaa 2760

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                 This invention describes a novel nucleic acid (I) comprising a promoter that is specific for tapetum and pollen. The invention also describes (a) expressible system containing at least one (I); (b) nucleic acid construct (II) containing (I) plus at least part of an expressible nucleic acid particularly plant cells, containing (I), the system of (a), or (II); (d) cells, particularly plant cells, containing (I), the system of (a), (II) or the vector of (c); (e) plants containing (I), the system of (a), (II) or the vector of (b); (g) hybrid seed produced by crossing a male sterile plant of (a); (b) production of male sterile plants by introducing (II) into a cell and regeneration to a plant; (i) restorer plants containing in one (or preferably many) cells a construct (IIa) of (I) and sequence that encodes an invertase different from the plants endogenous invertase; (j) plant that contains in one (or preferably many) cells both (II) and (IIa); (k) seeds from plants of (i) and (j); (l) fruits, particularly seedless, produced by plants of (e), (i) and (j); and (m) method for containing a prometer that is functionally homologous with (I). Constructs containing prometer that is functionally homologous with (I). Constructs containing prometer that is functionally produce seed to produce male-sterile plants (by co-suppression or antisense techniques) for preparation of hybrids, while constructs that contain (I) and a hard an invertase-encoding sequence are used to prepare response these plants are used for in vitro embryogenesis of haploid or (double) diploid plants, and the new plants particularly produce seedless fruits.

(I) can also be used to prepare transgenic plants that show increased or reduced production of endogenous materials, e.g. of plant horsenes or proteins involved in provision of energy to developing tissue. (I) contrained by the require expension or energies themselves and the new plants the subsection of themselves or provide high level expression in a tissue- and time-specific manner, and the new pla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3777 ATTÍTÍTÍTÍTÍTÍTÍTÁTAGGÁÁÁCGACCÁÁCTÍTÍGGÍCGGÍTÍTÍTCÍTTGGCGCÁÁÁAATGC 3718

The invention relates to DNA sequences with gene transcription regulatory qualities and methods for the detection and use of the regulatory DNA sequences. The invention further comprises providing a transcription system with a variety fragment-comprising vectors; and performing a selection step in the transcription system in order to identify a fragment comprising the DNA sequence with the gene transcription modulating activity. This polynucleotide represents a STAR element used in the method of the invention. The STAR element is shown to improve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             277
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Selecting a DNA sequence with a gene transcription modulating quality providing a transcription system with a variety fragment-comprising vectors and performing a selection step in the transcription system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     366 rearagereaargeaceageeggaaregaaceeggerereraeeggeaggeraera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TCTACCACTAGACCATTGGTTCATTTTGATTTAAGACTGTCTTTTATTTGATTTATACTC

                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                            The invention relates to DNA sequences with gene transcription regulatory qualities and methods for the detection and use of the regulatory DNA sequences. The invention further comprises providing a transcription system with a variety fragment comprising vectors; and performing a selection step in the transcription system in order to identify a fragment comprising the he gene transcription modulating activity. This polynucleotide represents a STAR element used in the method of the invention. The STAR element is shown to improve

The invention relates to a method of producing a proteinaceous molecule (I) in a cell comprising selecting a cell for its suitability for producing (I), providing a nucleic acid encoding (I) with a nucleic acid comprising a STabilising Anti-Repression (STAR) sequence, expressing the resulting nucleic acid in the cell and collecting (I). The method is useful for producing (I). A cell line (II) provided with a nucleic acid comprising a STAR sequence Is useful for producing (I). (II) Enables production of affiliated proteinaceous molecule, as cell carries out proper post-translational modifications of produced proteins. The present sequence represents a thale cress stabilising anti-repression, STAR,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             157

The invention relates to a method of producing a proteinaceous molecule producing cell comprising selecting a cell for its suitability for producing (I), providing a nucleic acid encoding (I) with a nucleic acid comprising a STabilishing Anti-Repression (STAR) sequence, expressing the resulting nucleic acid in the cell and collecting (I). The method is useful for producing (I). A cell line (II) provided with a nucleic acid comprising a STAR sequence Is useful for producing (I). (II) Enables production of affiliated proteinaceous molecule, as cell arrials proper post-translational modifications of produced proteins. The present sequence represents a thale cress stabilising anti-repression, STAR,
                Producing proteinaceous molecules in cells by selecting a cell, providing a nucleic acid encoding a proteinaceous molecule with an STabilizing Anti-Repression sequence and expressing proteinaceous molecule.

           expresses two or more proteins. The method comprises providing the cell with two or more proteins. The method comprises providing the cell proteins, having at least two of the protein expression units with at least one Stablizing Anti-Repressor (STAR) sequence. The method provides lincassed predictability in the production of recombinant cell lines that effectively produce heterologous multimeric proteins of interest, increase the yield of heterologous multimeric proteins, stable expression of heterologous multimeric proteins, stable expression. This polynucleotide sequence represents the DNA of a STablizing Anti-Repressor (STAR) sequence of the invention.
                                                                                                                                                                                                                                                                                                                                 157
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for obtaining a cell which expresses two or more proteins. The method comprises providing the cell with two or more protein expression units encoding the two or more protein expression units encoding the two or more proteins, having at least two of the protein expression units with at least one STablizing Anti-Repressor (STAR) sequence. The method provides increased predictability in the production of recombinant cell lines that effectively produce heterologous multimeric proteins of interest,
                                                                                                                                                                                                                                                                                                                                                                         307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Obtaining (MI) a cell which expresses two or more proteins, by providing cell with protein expression units encoding proteins, comprising protein expression units with STablizing Anti-Repressor sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein expression unit; STablizing Anti-Repressor; STAR; heterologous; multimeric; transgene expression; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   쉼
```

The present invention provides a number of human immune system associated dense which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and tractment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and mecular degeneration, arteriosclerosis, annemia, cancer, acute myeloid leukaemia, Albieimer's disease, AlbS. epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel

                                                                                                                                 The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid rebunancia Alzheimer's disease, AlDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named REC1-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                    GSS 04-JUN-1999

Determination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammosor in Pieter de Jons's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buiffalo, NY. The library is named RPCI-98 and was constructed by partial Ecost digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                        CNSOOKHX 905 bp DNA linear GSS 03-JUN-1999 Drosophila melanogaster genome survey sequence T7 end of BAC: BACR17N06 of RPCI-98 library from Drosophila melanogaster (fruit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Sequence 32, Application US/08544332
Patent No. 593577
GENERAL INFORMATION:
APPLICANT: MOYEN, Richard W.
APPLICANT: Hall, Richard L.
APPLICANT: Gruid!, Michael E.
TITLE OF INVENTION: No. 5935777el Entomopoxvirus Expression System NUMBER OF SEQUENCES: 77
CORRESPONDENCE ADDRESS:
ADDRESSES: Gerard H. Bencen
STREET: 2421 N.W. 41st Street, Suite A-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Patentin Release #1.0, Version #1.25
